Identifying recombinantly an antimicrobial bioactive peptide used as therapeutic agent involves transforming a host cell with expression vector with tightly regulable control region and measuring its inhibition

Example 3; Page 77; 135pp; English.

282866

C peptide (BP) involving transforming a cell with an expression vector in ucleic acid sequence encoding a peptide (P), growing the transformed cell under conditions that repress expression of (P) and then inducing its expression which, if is inhibitory to host cell growth, is indicative of BP expression. An antimicrobial peptide from the present inducing its expression which, if its inhibitory to host cell growth, is condition treatable with a peptide drug. The stabilised peptides are also used for inhibiting the growth of a microbial peptides are useful to treat various pathogenic bacterial such as its expression. Streptococci and Enterococci which are the primary causes of nosocomial infections. Movel inhibitor peptides can be used. In turn, to identify additional novel antibacterial peptides can be used. In turn, to identify additional novel antibacterial peptides can be used. In turn, to identify additional novel antibacterial peptides using a construction and can also be used to elucidate potential new drug targets. The inhibitor peptide target which is inactivated is identified to be used to perform the performance inhibited to the prefix are the primary causes in turn, to identify additional novel antibacterial peptides can be used. In turn, to identify additional novel antibacterial peptides using a construction of the performance of the performance inhibited to be performed and the performance of the performance inhibited that are no longer inhibited to be performed and the performance inhibited in the performance and the performance inhibited to be performed and the performance inhibited to be performed and performance inhibited to be performed and performance in performance inhibited to the performance inhibited that are no longer inhibited to be performed and performance inhibited that are no longer inhibited to the performance and the performance inhibited to the performance in the perf by the peptide. These mutants are then mapped in order to precisely determine the protein target that is inhibited. AAA56033 to AAA56100 AAY90964 to AAY90999 are sequences used in the exemplification of the protein target that is inhibited. The present invention describes a method for identifying a bioactive AAA56033 to AAA56106 and

Novel polynucleotides and proteins having by make them suitable for treating, preventing conditions in humans or animals having biological activities which reventing or ameliorating medical

WPI; 2000-053095/04.

Claim 67; Page 621-622; 730pp; English

vaccines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/ chemokinetic activity, haemostatic and thrombolytic activity, receptor/ ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful for gene therapy. Therapeutic compositions The present invention describes human secreted proteins encoded by polynucleotides obtained from adult testes, foetal brain, adult brain, brain (foetal and adult), foetal kidney, adult spleen, and adult thymus cDNA libraries. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as

            acidic dipeptidase L (NAALAD-ase L) splice variant, predicted from cDNA (see AAZ58309) obtained during 3' RACE amplifications of small intestine, colon, brain and foetal brain cDNA. The splice variant is prematurely terminated compared with the active protein (see AAZ58870) owing to a 173-nucleotide deletion that results in a frame-shift. Several NAALAD-ase L splice variants (see AAY58871-77) have been identified. Their biological significance has yet to be determined, but inactive variants may be used to regulate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 determined, but inactive variants may be used to regulate the levels of active protein. The invention provides human NAALAD-ase L (and splice variant), II and IV polypeptides, CDNAs, antisense nucleic acids, vectors, host cells, transgenic organisms, antagonists and agonists. These are useful for treating neural disorders such as Alzheimer's disease, schizophrenia, ALS, Parkinson's disease, peripheral neuropathy, Huntington's disease, acute brain injury, multiple sclerosis, exposure to neurotoxins, peripheral nerve trauma, ischaemia or dementia (claimed).
                                                                                                                                                                                                                                                                                                                                                                                 Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY58876 standard; Protein; 578 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   derived

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NAALAD-ase L; N-acetylated alpha-linked acidic dipeptidase; h chromosome 11q12; prostate cancer; neurodegenerative disease; alzheimer's disease; schizophrenia; ALS; Parkinson's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          intestine, colon, brain and foetal brain CDNA. The splice variant is prematurely terminated compared with the active protein (see AAY58870) owing to an intronic insertion into CDNA that caused a frame-shift. Several NAALAD-ase L splice variants (see AAY58871-77) have been identified. Their biological significance has yet to be determined, but inactive variants may be used to regulate the levels of active protein. The invention provides human NAALAD-ase L (and splice variant), II and IV polypeptides, CDNAs, antisense nucleic acids, vectors, host cells, transgenic organisms, antagonists and agonists. These are useful for treating neural disorders such as peripheral neuropathy, Huntington's disease, acute brain injury, multiple sclerosis, exposure to neurotoxins, peripheral nerve trauma, is the server of t

acidic dipeptidase L (NANLAD-ase L) splice variant; predicted from cDNA (see AAZ5831) obtained during 3' RACE amplifications of small intestine, colon, brain and foetal brain cDNA. The splice variant is prematurely terminated compared with the active protein (see AAX58870) owing to an intronic insertion into cDNA that caused a frame-shift. Several NANLAD-ase L splice variants (see AAY58871-77) have been identified. Their biological significance has yet to be determined, but inactive variants may be used to regulate the levels of active protein. The invention provides human NANLAD-ase L (and splice variant), II and IV polypeptides, cDNAs, antisense nucleic acids, vectors, host cells, transgenic organisms, antagonists and agonists. These are useful for treating neural disorders such as Alzheimer's disease, schizophrenia, ALS, Parkinson's disease, peripheral neuropathy, Huntington's disease, acute brain injury, multiple sclerosis, exposure to neurotoxins, peripheral nerve trauma, ischaemia or dementia (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ESULT 10

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        L (and splice variant), II and IV polypeptides, cDNAs, antisense nucleic acids, vectors, host cells, transgenic organisms, antagonists and agonists. These are useful for treating neural disorders such as Alzheimer's disease, schizophrenia, ALS, Parkinson's disease, peripheral neuropathy, Huntington's disease, acute brain injury, more peripheral neuropathy, exposure to neurotoxins, peripheral nerve trauma, included a scheme of the contraction of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          intestine and colon cDNA. The splice variant carries a deletion of amino acids 161-201 of NAALAD-ase L (see AAY58870). Several NAALAD-ase L splice variants (see AAY58871-77) have been identified. Their biological significance has yet to be determined, but spliced out residues may affect levels of glycosylation and the conformation and activity of the protein. The invention provides human NAALAD-ase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY58872;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY58872 standard; Protein; 705 AA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          amino acids 296-301 of NANLAD-ase L (see ANY58870). Several MANLAD-ase L splice variants (see ANY58871-77) have been identified. Their biological significance has yet to be determined, but spliced out residues may affect levels of glycosylation and the conformation and activity of the protein. The invention provides human NANLAD-ase L (and splice variant), II and IV polypeptides, CDNAs, antisense nucleic acids, vectors, host cells, transgenic organisms, antagonists and agonists. These are useful for treating neural disorders such as peripheral neuropathy, Huntington's disease, acute brain injury, multington account to the content of the conten

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      out residues may affect levels of glycosylation and the conformation and activity of the protein. The invention provides human NAALAD-ase L (and splice variant), II and IV polypeptides, cDNAs, antisense nucleic acids, vectors, host cells, transgenic organisms, antagonists and agonists. These are useful for treating neural disorders such as Alzheimer's disease, schizophrenia, ALS, Parkinson's disease, peripheral neuropathy, Huntington's disease, acute brain injury, multiple sclerosis, exposure to neurotoxins, peripheral nerve trauma, ischaemia or dementia (claimed).

Note: The present sequence is not shown in the specification but is

                                                                                                                                                                                                                                      The present sequence is that predicted for human N-acetylated alpha-linked acidic dipeptidase L (NAALAD-ase L) on the basis of isolated cDNA (see AAZ58304). NAALAD-ase L is predicted to be a type II integral membrane protein with 78% identity and 87% similarity to rat NAALAD-ase L. It is most highly expressed in small intestine, spleen and testis. Several splice variants (see AAX58871-77) were identified during the course of CDNA cloning and RT-PCR gene expression analysis. The invention provides human NAALAD-ase L, II and IV cDNAs and encoded polypeptides, as well as vectors, host cells, transgenic organisms, antisense nucleic acids, agonists and antagonists. These are useful for treating neural disorders such as Albeimer's disease, schizophrenia, ALS, parkingon's disease participated.
                                                                                                                                                                Parkinson's disease, peripheral neuropathy, Huntington's disease, acute brain injury, multiple sclerosis, exposure to neurotoxins, peripheral nerve trauma, ischaemia or dementia (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human N-acetylated alpha-linked acidic dipeptidases for treating neural disorders e.g. Alzheimer's disease, schizophrenia and Parkinson's disease

The invention includes peptide sequence for three synthetic HK hormones (AAB12945-B12947) these peptides help regulate the physiological processes enabling the growth of Helicoverpa zea (corn earworm) larvae. Infestations of H. zea are a major cause of crop loss. The recombinant baculovirus of the invention containing DNA encoding a hormone with HK activity can be used for controlling populations of H. zea and other related crop pest species. The present sequence represents a synthetic helicokinin III hormone peptide. The peptide is used in the production of the baculovirus of the invention.

Sequence

Description

score and is

ce gréater t is derived

No. 1s the number of results predicted by chance to have a greater than or equal to the score of the result being printed, s derived by analysis of the total score distribution.
